Molecular Interpretation of the Moduli of Elastomeric Polymer Networks of Known Structure

J. P. Queslel and J. E. Mark
Department of Chemistry and the Polymer Research Center,
The University of Cincinnati, Cincinnati, Ohio 45221, USA

The most general molecular theory of rubberlike elasticity is reviewed as a preliminary to its use in the interpretation and understanding of the moduli of model elastomeric materials, i.e., polymer networks prepared in such a way that their structure is relatively well known. Applications are made to both perfect and imperfect networks, with critical evaluation of evidence possibly attributable to equilibrium elastic contributions from interchain entanglements. The relevance and importance of branching theory is covered in some detail.

1 Introduction .................................. 137

2 Review of Molecular Theory .................... 137
  2.1 The Phantom Limit .......................... 137
  2.2 The Affine Limit ............................ 138
     2.2.1 General Comments ....................... 138
     2.2.2 Swelling Equilibrium .................... 139
  2.3 Real Networks ............................... 139
     2.3.1 Stress-Strain Measurements in Elongation ...... 139
     2.3.2 Swelling Equilibrium .................... 141

3 The Use of Model Networks ...................... 141

4 Experimental Data ............................... 142
  4.1 Completeness of the Cross-Linking Reaction ........ 142
  4.2 Structure Factors Obtained in Elongation Studies ...... 143
     4.2.1 General Comments ....................... 143
     4.2.2 High-Deformation Limit .................. 143
     4.2.3 Low-Deformation Limit ................... 146

5 Perfect End-Linked Networks .................... 148
  5.1 The Parameters $\alpha$ and $\zeta$ ................ 148
  5.2 The Parameter $h$ ........................... 152

6 Imperfect End-Linked Networks .................. 153
  6.1 Branching Theory ............................ 153
  6.2 Structure Factors Obtained in Elongation Studies ...... 156
     6.2.1 High-Deformation Limit .................. 156
     6.2.2 Low-Deformation Limit ................... 157
